                                                                                                                                                                                                                                                                                                                                                       8
                                             The present invention relates to a monoclonal antibody against an egglutinia-like sequence (ALS) 1 protein that specifically binds an epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein

      The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS) 1 protein that specifically binds an epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein
                                                                                                                                                                                                                                                     120

epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein

The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candid

New monoclonal antibody against Candida albicans agglutinin-like sequence 1 adhesin proteins, for use as a vaccine to treat or prevent disseminated candidiasis, or to generate an immune response that blocks adherence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an applicate in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is candida albicans agglutinin-like sequence (ALS) protein

                                                                                             The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candid albicans agglutinin-like sequence (ALS) protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New monocional antibody against Candida albicans agglutinin-like sequence 1 adhesin proteins, for use as a vaccine to treat or prevent disseminated candidiasis, or to generate an immune response that blocks adherence of the organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an application an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidates and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein

The alpha-agglutinin is used in a method to immobilise enzymes to a microbial cell wall. The coding sequence is used in the production of a recombinant polynuclectide which comprises a structural gene encoding a protein with catalytic activity and at least part of a gene encoding at least the C-terminus of a protein capable of anchoring in a eukaryotic or prokaryotic cell wall. The anchoring fragment or protein is selected from alpha agglutinin, AGA 1, FLO 1, major cell wall protein of lower eukaryotes or a proteinase of lactic acid bacteria. The recombinant polynucleotide preferably also comprises a sequence encoding a signal appetide to ensure secretion of the expressed product. The signal peptide is preferably derived from glycosyl-phosphatidyl-inositol, anchoring protein, alpha factor, alpha-agglutinin, invertase or inulinase, alpha-

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

claim 1; SEQ ID NO 22177; 122pp; English

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant cauch as majored property. The plant is a crop plant cauch as migroved property comprises transforming a plant with the calcombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the polynucleotide or polypeptide is useful for improving plants with increased resistance to plant disease, better growth rate by modification of improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to plant disease, better growth rate by modification of increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or production, improved lighin production or improved galactomannan content, improved lighin production or improved galactomannan production, improved lighin production or improved galactomannan production, improved lighin production or improved galactomannan compact for part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic content from USPTO at sequence rate sequence enter them.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide actoring at least 8 amino acids of any of the 6888 amino acid sequences on the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences on conciding at least 8 amino acids of any of the 6888 amino acid sequences of ully defined in the specification. The probe is a single exon probe that human cells or tissues. Also included are a spatially—adversable even included are a spatially—adversable or the final probes for measuring human cells or included are a spatially—and addressably solateble or amplifiable from the plurality, a single conditions amino acid and addressably solateble or amplifiable from the plurality, a single exon microarray for measuring human gene expression, a wector comprising the single exon measuring human gene expression, a method of even exon or contiguous amino acids of any of the above-mentioned amino acid succession and address of the above-mentioned amino acid above, and or licensing single exon probes or microarrays to measure gene expression, and a comprising a customer destring to measure gene expression, and a computer-readable contiguous amino acids and pace expression, and a computer-readable contiguous much the probes may be used as tools for surveying the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes of expression analysing exon or in constructing genome-derived single exon probe protein of the invention. Note: T New human genome-derived single exon nucleic acid probes useful for hum: gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues. The invention relates to human novel polynuclectides and associated colypeptides. The polynuclectides and polypeptides are useful for treating inflammatory conditions such as arthritis, meghritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain tissue, and are useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral cativity, regulation of haematopolesis, treatment of myeloid or lymphoid cativity, regulation of haematopolesis, treatment of myeloid or lymphoid cativity, regulation of bone, obtains, incisions, ulcers, treatment of cativity, regulation of bone, and purns, incisions, ulcers, treatment of growth, tissue repair, healing of burns, incisions, ulcers, treatment of disease. The sequences of the invention are also useful for gut to reperfusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SIDD), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis and mysathenia cand received the sathma, thrombolysis or thrombosis
                                                                                                                                                                                       Human; inflammatory condition; shock; sepsis; immune response; cancer; wound healing; central nervous system disease; haematopoiseis; peripheral nervous system disease; amyotrophic lateral solerosis; tendon; myeloid call disorder; lymphoid cell disorder; platelet disorder; bone; cartilage; ligament; nerve tissue; ulcer; osteoporosis; osteoarthritis; bone degenerative disorder; periodntal disease; reperfusion injury; lung fibrosis; liver fibrosis; autoimmune disorder; bacterial infection; allergic condition; thrombolysis; thrombosis; coagulation disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acids and polypeptides for diagnosis, treatment of inflammatory, autoimmune, nervous system, myeloid or lymphoid cell disorders, cancer and promoting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang

The invention relates to human novel polymucleotides and associated colypeptides. The polymucleotides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain tissue, and are useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis. The sequences are involved in chemotactic or chemokinetic activity, regulation of hamatopolesis, treatment of myeloid or lymphoid cativity, regulation of shome, cartilage, tendon, ligament and/or nerve tissue cregeneration of bone, cartilage, tendon, ligament and/or nerve tissue cremeration of bone, cartilage, tendon, ligament and/or nerve tissue growth, tissue repair, healing of burns, incisions, ulcers, treatment of disease. The sequences of the invention are also useful for gut protection or regeneration and treatment of lung or liver fibrosis, creperfusion injury in various tissues, immune deficiencies and disorders infections, autoimmuna disorders e.g. multiple sclerosis and myasthenia gravis, allergic conditions such as asthma, thrombolysis or thrombosis and coagulation disorders. Sequences ABG6666-ABG66758 represent human coagulation man invention

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is postitioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant cauch as maize or soybean. The method of producing a plant with the crecombinant DNA construct and growing the transformed plant, where the compinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the compinant properties. The recombinant DNA construct is useful for improving plants with the compinant properties. The recombinant DNA construct is useful for improving plants with the coll properties, extreme communic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of carbohydrate, nitrogen or content, improved yield by modification of carbohydrate, nitrogen or

phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.
```

CC phosphorus in providing in CC condition, CC production, CC scope of the CC form part of CC format from XX SQ Sequence 133	phosphorus u providing im condition, i production. scope of the form part of format from	phosphorus use and/or upta providing improved plant g condition, improved lignin production. This sequence scope of the invention. No form part of the printed s format from USPTO at seqda Sequence 1322 AA;	t to the second	modification of nd development tion or improve nts a bacterial sequence data ation but was c o.gov/sequence	tion of photosynthesis or by opment under at least one stress improved galactomannan cterial polypeptide used in the e data for this patent did not t was obtained in electronic quence.html.

Submitted (08-58P-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (B-mail: sequerégenoscope.nas.fr. Web: 1 ruis GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazil, Zygosaccharomyces rouxil. Saccharomyces rouxil actis var. lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces thansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of

Submitted (08-SEP-2000) Genoscope - Centre National de Sequencage, Submitted (08-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (B-mail: Sequence construction of thirteen sequence of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces esrvazzii, Zygosaccharomyces rouxii, Saccharomyces Bervazzii, Zygosaccharomyces Kluyveromyces saccharomyces kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolyfica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SM Candida tropicalis

(E-mail: seqref@genoscope.cns.fr - Web: This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces ervazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces harverii, Kluyveromyces thermoclolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2 (bases 1 to 1011)
